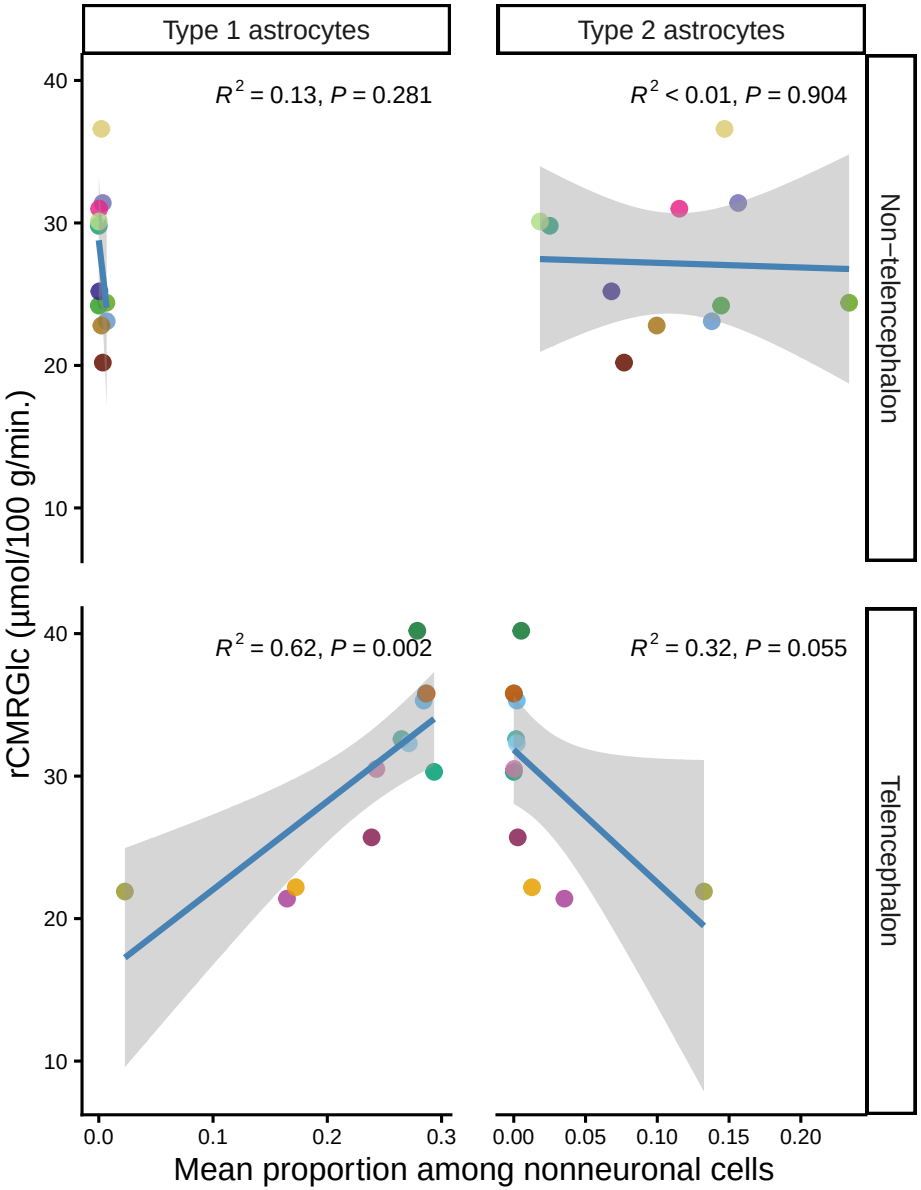
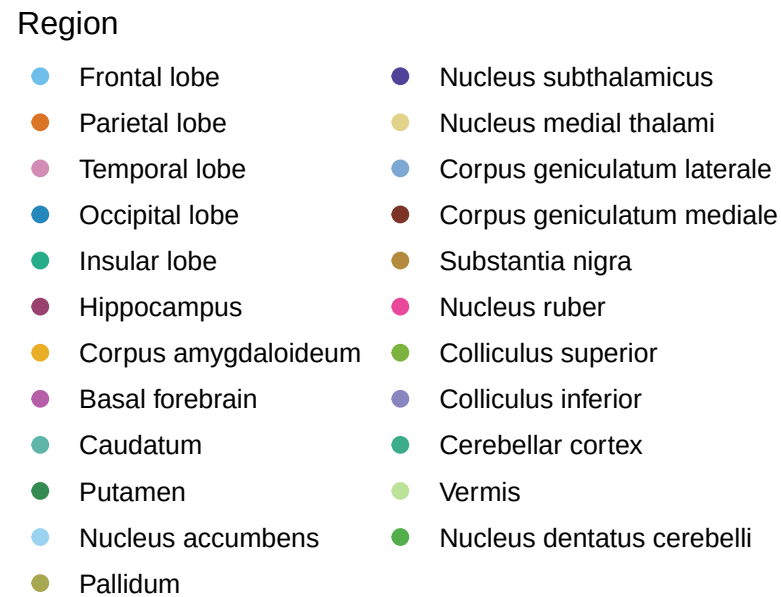
Telencephalic (Type 1) vs non−telencephalic (Type 2) astrocyte proportions vs regional glucose metabolism (rCMRGlc)

Columns: astrocyte type. Rows: telencephalon vs non−telencephalon. Points are brain regions.





Siletti et al. (2023) grouped 13 astrocyte clusters into telencephalic (Type 1) and non−telencephalic (Type 2) types, each with GFAP−low and −high populations. Type 1 includes human cortical populations: WIF1+ gray−matter, TNC+ white−matter and LMO2+ interlaminar astrocytes. Proportions are each type as a fraction of all nonneuronal cells. Lines are OLS fits with 95% CI (R^2 and p shown). In our data, telencephalic regions show a positive relationship between rCMRGlc and the Type 1 / all−nonneuronal proportion; the Type 2 relationship is negative and borderline (not quite significant). Non−telencephalic regions show no such relationship.
