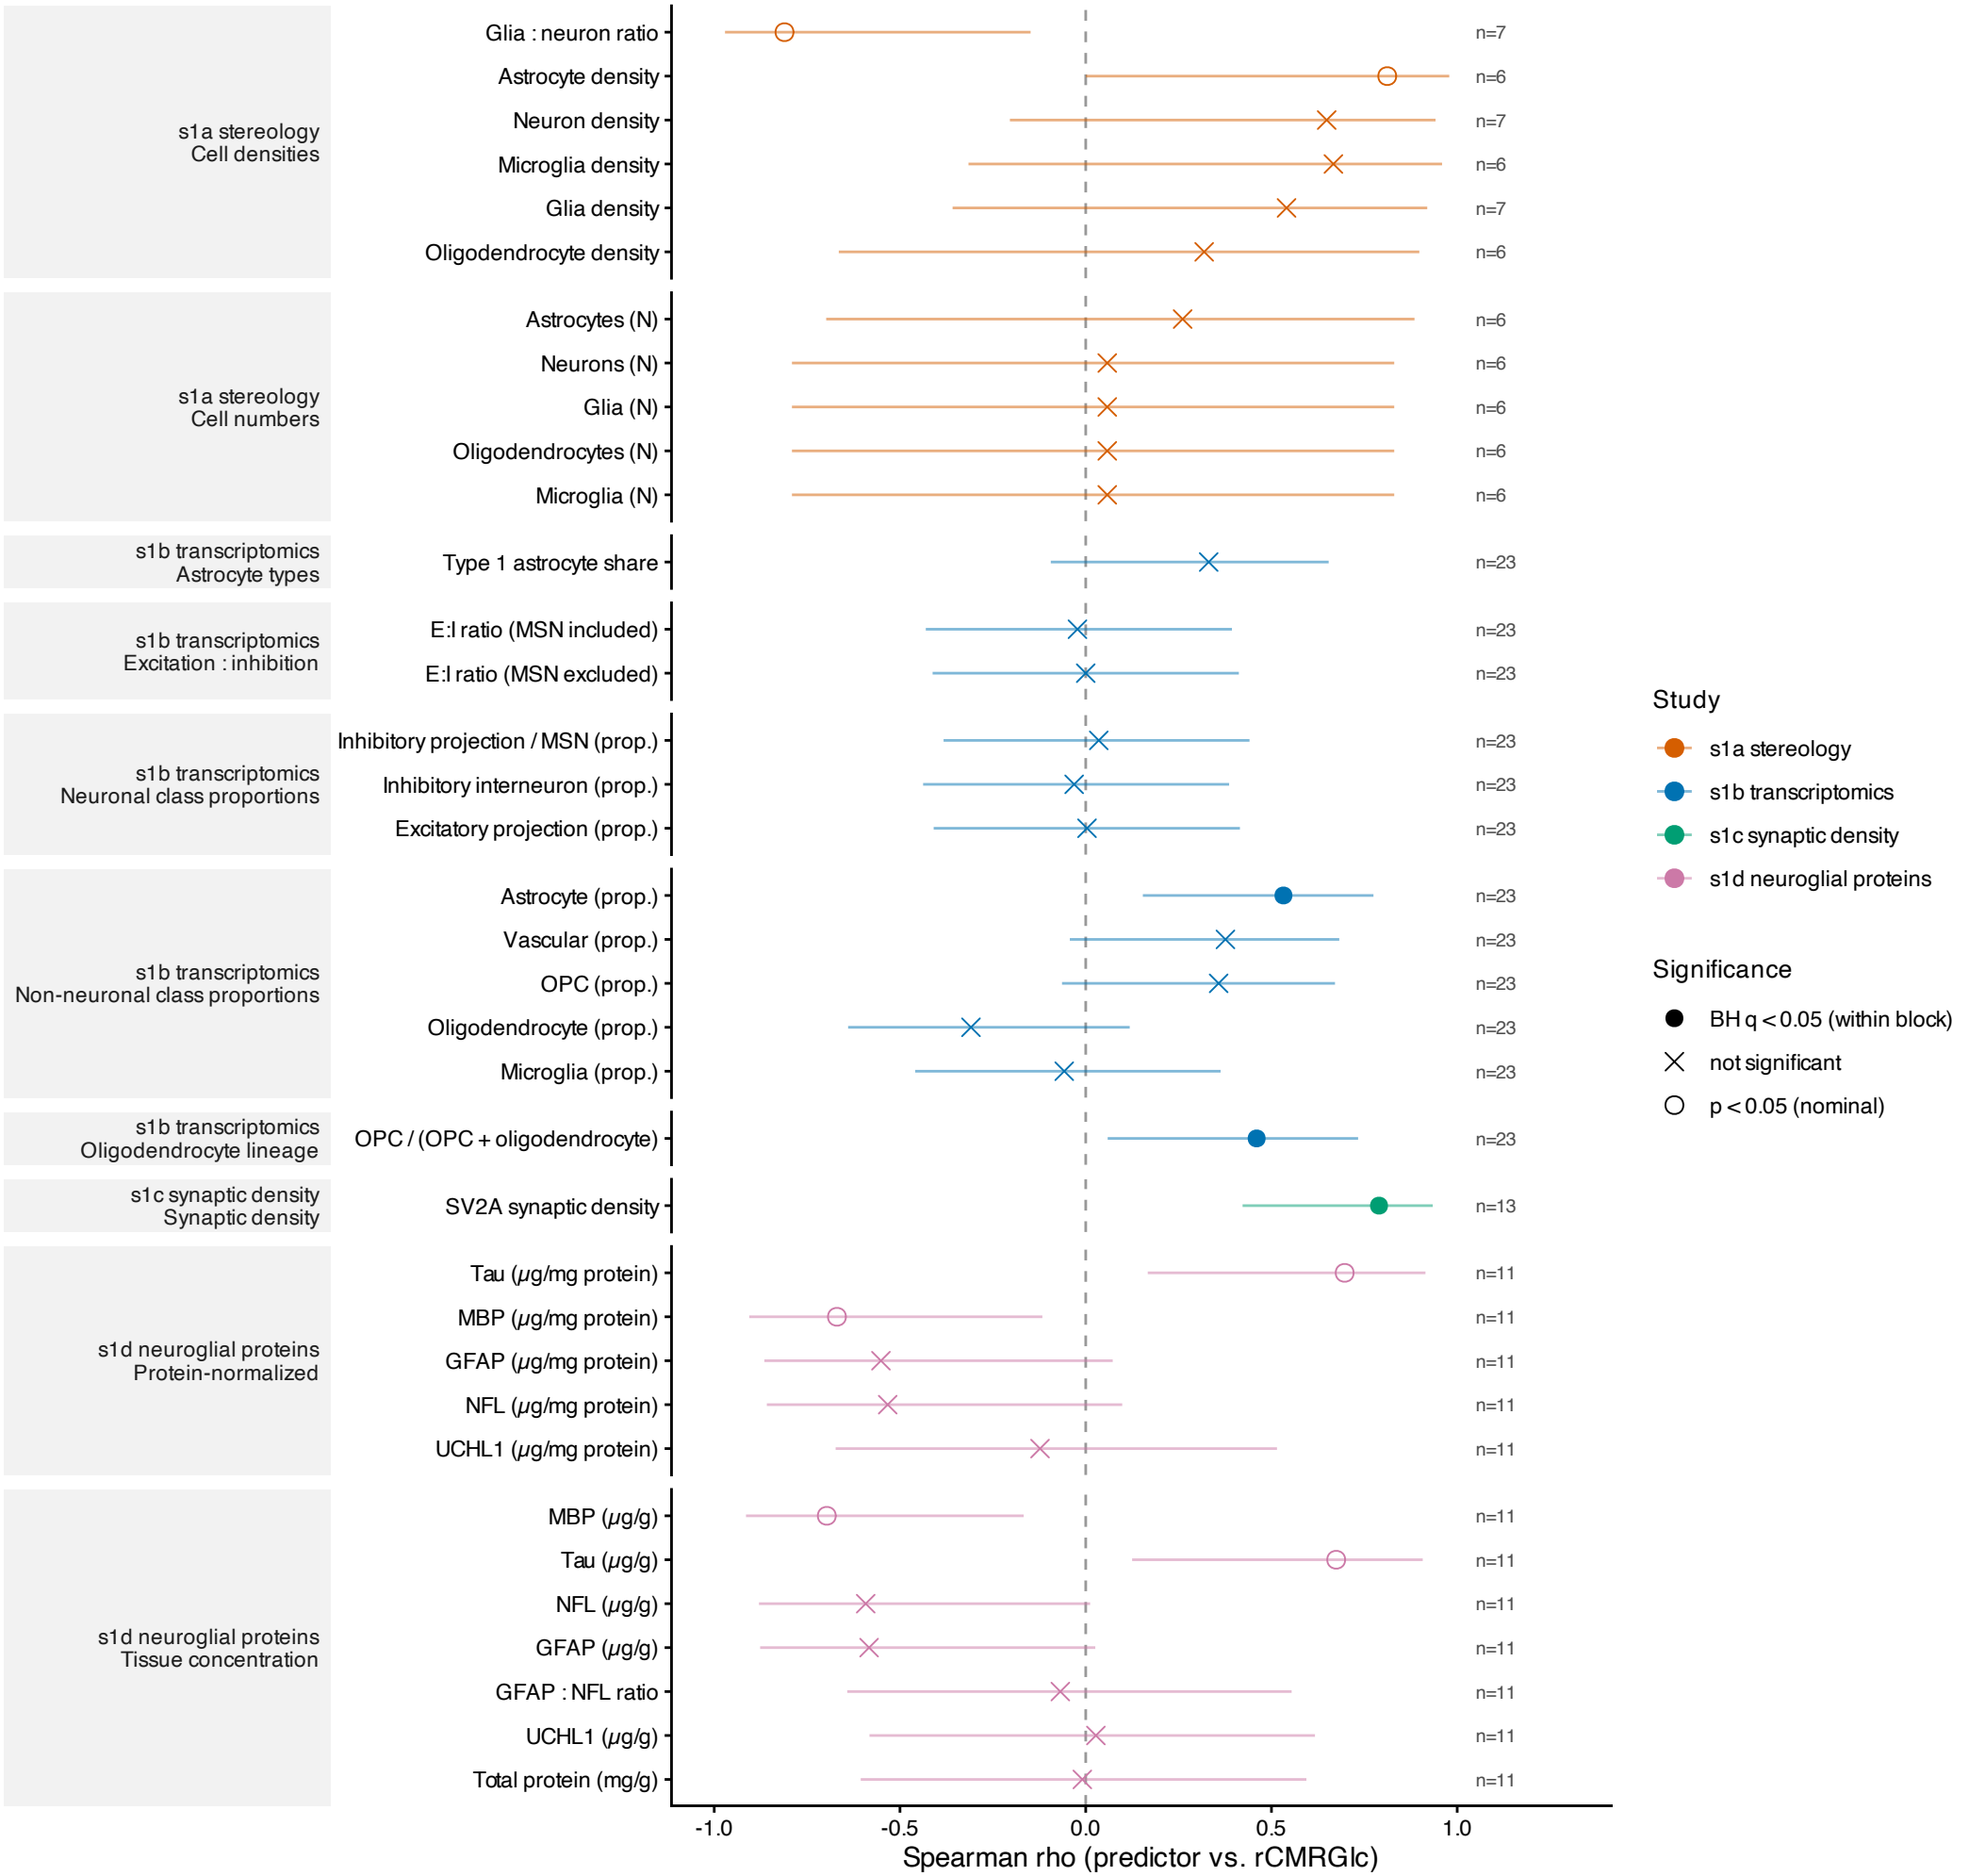
Study 1: which regional tissue properties track glucose metabolic rate?

Spearman rho vs. Heiss et al. 2004 rCMRGlc, recomputed uniformly from each study's region-level table



Bars = approximate 95% interval (Fisher z); n = regions paired with a Heiss rate.
BH adjustment within each study x block, as in the study scripts.
Region sets differ between studies (see region-coverage figure): rho values are comparable in sign and size but are not estimated on the same regions.
