

**Regional glucose metabolism vs neuronal E:I ratio:
broad all-region, MSN excluded, with Jorstad-like cortical overlay**

Each cortical region appears twice: grey = broad all-region E:I; blue = Jorstad-like cortical E:I.

Grey points/line: all mapped brain regions. E:I = excitatory-projection / inhibitory-interneuron superclusters. Medium spiny neurons are excluded from the inhibitor. Blue points/line: cerebral cortical regions only. E:I uses only cortical excitatory and inhibitory supercluster families crosswalked to Jorstad et al. (2023) neocortical I. Blue excludes MSN and excludes thalamic, hippocampal, cerebellar, and midbrain cell types. Lines are OLS fits with 95% CI. Jorstad et al., Science 382, 176 (2023).
